PWS, settlement and peak-hour decision report

This report reframes the analysis around the two moments that matter for a weather trade: the previous local day, when brackets can still be mispriced, and the late intraday window close to the official daily high, where PWS can help you move before the crowd.

Window analyzed
2026-02-27 to 2026-03-08

Settlement truth
NOAA METAR cumulative max in the logs

Important caveat
Logs only retain D-1 to D, so there is no clean D-2 readout in this report

Simple reading

Best peak-hour candidate

KORD, KDAL

Best day-ahead candidate

KLGA, EGLC, KMIA, LFPG, LTAC

Use as confirmation

None

Main conclusion: there is no universal PWS edge across all markets close to the peak. The strongest late tactical candidates in this sample are KORD and, with less evidence, KDAL. Several other markets look more interesting one day before than in the intraday chase: KLGA, EGLC, KMIA, LFPG and LTAC all show previous-day windows where the final winner is visible at a still-manageable probability.

What was measured

- **Day-ahead:** previous local day only, split into four windows. The report checks whether the final official winner was already top1 or top3, and at what probability.
- **Peak-hour:** only setups where the final official winning bracket was still open. The PWS proxy is defined as **max(current official max, next official expected by the PWS consensus)**.
- **Best PWS station:** taken from the historical audit rows by lowest MAE and strongest hit rate, with a minimum row threshold when available.

Overall window summary

Previous-day visibility of the final winner

WINDOW	SAMPLES	WINNER TOP1	WINNER TOP3	WINNER AVG PROBABILITY
D-1 00-06	32934	20.4%	45.0%	29.2%

KORD Chicago O'Hare International

Peak-hour candidate

America/Chicago

Best tactical candidate in this sample. PWS improves the late bracket call more than the market in at least one robust local block.

Best moments

Context

- **Day-ahead:** D-1 00-06 | final winner in top3 48.3% | average winner price 21.8%
- **Peak-hour:** 11-13 local | PWS proxy 22.2% vs market top1 0.0% | edge 22.2%
- **Lead window:** 05-15 | MAE 0.511C | hit@1.0C 79.1%
- **Best single PWS:** KILBENSE15 (WUNDERGROUND) | MAE 0.360C | hit@1.0C 91.3%

- **WU minus official max:** 3.10F on average across the window.
- **Use this market as:** Peak-hour candidate.
- **Interpretation:** day-ahead numbers tell you how visible the final winner already was on the previous day; peak-hour numbers tell you whether a PWS-based next-step proxy beats the market close to the official daily high.

Lead buckets by station

LEAD BUCKET	ROWS	MAE	HIT @1.0C

IANKAR28	WUNDERGROUND	Ankara	280	2.187C	35.4%

Practical takeaways

- **KORD** is the cleanest tactical market in this sample. It combines the best raw PWS quality with the best robust peak-hour edge.
- **KDAL** also shows a usable late pocket, but the evidence is thinner and should be treated as more selective than KORD.
- **KMIA**, **KLGA** and **EGLC** are more convincing as previous-day markets than as late PWS-chase markets. The final winner is often visible early enough, but the late proxy does not consistently beat the board.
- **LFPG** and **LTAC** should be treated as previous-day only at most. The report does not show a reliable late intraday edge there.
